

## Mobile solutions for telemedicine

Medical trolleys are an important part of healthcare facilities and intensive care areas. Lightweight, customisable, suitable for infection control and easy to manoeuvre, trolleys provide fast, flexible access to medical equipment. A well-designed medical trolley not only improves the lives of carers and patients, it protects them. That's why IEC 60601-1 compliance should be your first consideration when buying a medical trolley. All our trolleys, whether pre-configured models or customised solutions, are fully compliant. Our medical trolleys are collapse-resistant. They undergo impact and threshold tests to ensure they are resistant to accidents and general wear and tear. We take into account infection prevention, rough handling, user stress, traction safety factors, correct labelling or pinch points. Safety without compromise when it comes to people's lives and well-being.

### Modularity without fear and height-adjustable

Modularity is the use of similar modules in several products.

It allows designs to be customised, improved, repaired or adapted to future demands. With fewer than 100 components, ErgonoFlex can offer thousands of combinations of trolleys.

The advantages of modularity are obvious. While exchanging components as needs change seems to optimise return on investment, it should not be forgotten that the adaptation of a medical product must be meticulously documented to prove conformity and, subsequently, traceability.

At ErgonoFlex, we never leave anything in the grey zone
